Introduction to hybrid and multicloud

Article • 11/04/2021 • 6 minutes to read • 3 contributors

Microsoft Azure provides all of the products and features required to help you build and operate your technology solutions in the cloud. We also understand that there are sound business reasons that may drive the necessity of using multiple private and public clouds. As a first step in your hybrid and multicloud journey, this article outlines and expands on Microsoft's unique perspective on important cloud computing terms.

Watch the following video to learn more.

Microsoft launches landing zone accelerator for Azure Arc-enabled servers

Posted on January 27, 2022

[Vijay Kumar](#), Director, Windows Server and Azure Product Marketing

We continue to innovate and add new capabilities to Azure Arc to enable new scenarios in hybrid and multicloud. We also want to provide our customers with the right guidance and best practices to adopt hybrid and multicloud technologies to meet their business needs. Today we're launching the [Azure Arc-enabled servers landing zone](#) accelerator within the Azure [Cloud Adoption Framework](#). The landing zone accelerator provides best practices, guidance, and automated reference implementations so that customers can get started with their deployments quickly and easily.

Azure Arc-enabled servers landing zone accelerator makes it easier for customers to increase security, governance, and compliance posture on servers that are deployed outside of Azure. Along with Azure Arc, services such as Microsoft Defender for Cloud, Azure Sentinel, Azure Monitor, Azure Log Analytics, Azure Policy, and many others are included in the reference implementations that can then be extended to production environments.

Design areas within the landing zone accelerator

The Azure Arc-enabled servers landing zone accelerator enables customers' cloud adoption journey with considerations, recommendations, and architecture patterns most important to customers. For deploying Azure Arc-enabled servers in the most recommended way, we created a set of seven critical design areas. Each of these specific areas, walks customers through a set of design considerations, recommendations, architectures, and next steps:

- Identity and access management
- Network topology and connectivity
- Resource organization
- Governance and security disciplines
- Management disciplines
- Cost governance
- Automation disciplines

With both Azure Arc-enabled servers and Kubernetes Landing Zone Accelerators already generally available, today we're launching the [Azure Arc-enabled SQL Managed Instance landing zone accelerator](#) within the Azure [Cloud Adoption Framework](#).

The new solution provides hybrid and Multicloud scenarios within the Azure [Cloud Adoption Framework](#), a proven set of guidance designed by subject matter experts across Microsoft to help customers create and implement the business and technology strategies necessary to succeed in the cloud as well as a way to automate a fully deployed Azure Arc-enabled SQL Managed Instance environment, making implementation faster.

Announcing Jumpstart ArcBox for DataOps

By  Lior Kamrat

Published Oct 12 2022 07:58 AM

735 Views

With the Azure Arc portfolio keeping on growing and reaching so many customers, and with Azure Arc-enabled data services being such an important piece in the Azure Hybrid puzzle, today, we are announcing ArcBox for DataOps.

What we've been hearing from customers and partners is that the Azure Arc Jumpstart is such an instrumental part of their Azure Arc learning journey and with the combination of the [newly announced Azure Arc-enabled SQL Managed Instance landing zone accelerator](#), ArcBox for DataOps, is our road-tested automation providing our customers a way to get hands-on with the Azure Arc-enabled SQL Managed Instance set of capabilities and features.

Introducing ArcBox for DataOps

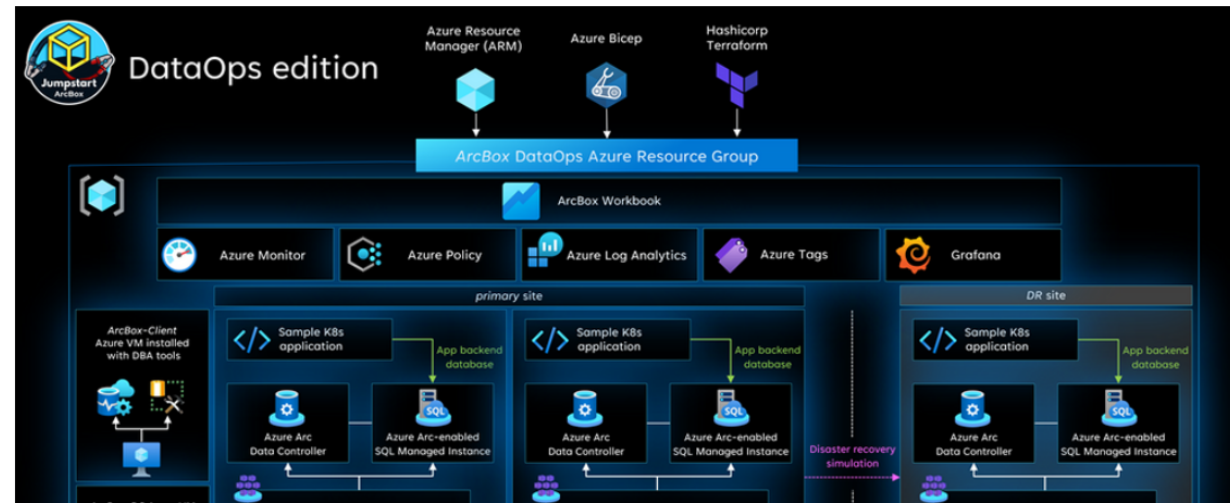

With ArcBox for DataOps, we're bringing the same proven core design principles of the Azure Arc Jumpstart to this new offering. Providing a painless, fully automated deployment for all things Azure Arc is the founding principle of our ArcBox offerings.

We wanted to provide a way for our customers to experience Azure Arc-enabled SQL Managed to its fullest right away, so we baked in multiple Jumpstart scenarios.

ArcBox for DataOps provides users with a rich, fully automated Azure Arc-enabled SQL Managed Instance so they can experience and simulate capabilities like disaster recovery, SQL Backup and Restore, Active Directory integration, and more, all while also having a comprehensive unified operation and management layer that can then be expanded to serve production workload.

The entire solution is automatically deployed and includes all required Azure integrations, as well as three Kubernetes clusters and the supported Azure infrastructure alongside a sample application so users will have everything they need to get hands-on with the tech.

To complete the experience, ArcBox has additional built-in integrations for a richer experience with Azure Monitor, Policy, Log Analytics, and Grafana. We also support all deployment types so you can pick whatever method suits your needs and skillset - Bicep, ARM Templates, and Terraform are all included.

Remote server management is a critical tool for server administrators. Whether you are running automation or using interactively, SSH based remoting is to connect to your remote server. Starting today, you can now securely [SSH into your Arc enabled servers](#) without a public IP address or additional inbound ports!

SSH access to Arc enabled servers allows you to SSH into your Arc onboarded servers with a simple Azure CLI command (Azure PowerShell coming soon)! Leverage your existing local SSH keys, username/passwords to connect to either [Windows](#) or Linux servers. Additionally, you can SSH using your [Azure AD credentials](#) (currently available on Linux-only).

Using Arc enabled servers and SSH access you can now access any of your machines, in any network, with one command without exposing a public IP address or opening additional inbound firewall ports. SSH traffic is sent over the existing connection between the Azure Arc agent and Azure, no extra configuration is required. Additionally, we are committed to providing a secure and consistent experience across operating systems, Arc servers & Azure VMs, and authentication types. This means that the same command, `az ssh vm`, can be used to access any of your machines. Providing a consistent, easy to understand, automatable solution for accessing your machines with SSH.

```
PS C:\Users\[redacted] > az ssh vm --resource-group Resource --name VM name --local-user user

What's new with Azure Arc-enabled servers agent

Article • 10/12/2022 • 4 minutes to read • [8 contributors](#)

The Azure Connected Machine agent receives improvements on an ongoing basis. To stay up to date with the most recent developments, this article provides you with information about:

- The latest releases
- Known issues
- Bug fixes

This page is updated monthly, so revisit it regularly. If you're looking for items older than six months, you can find them in [archive for What's new with Azure Arc-enabled servers agent](#).

Version 1.23 - October 2022

New features

- The minimum PowerShell version required on Windows Server has been reduced to PowerShell 4.0
- The Windows agent installer is now compatible with systems that enforce a Microsoft publisher-based Windows Defender Application Control policy.
- Added support for Rocky Linux 8 and Debian 11.

Understand deployment options for the Azure Monitor agent on Azure Arc-enabled servers

Article • 09/15/2022 • 3 minutes to read • 5 contributors

Azure Monitor supports multiple methods to install the Azure Monitor agent and connect your machine or server registered with Azure Arc-enabled servers to the service. Azure Arc-enabled servers support the Azure VM extension framework, which provides post-deployment configuration and automation tasks, enabling you to simplify management of your hybrid machines like you can with Azure VMs.

The Azure Monitor agent is required if you want to:

- Monitor the operating system and any workloads running on the machine or server using [VM insights](#).
- Analyze and alert using [Azure Monitor](#).
- Perform security monitoring in Azure by using [Microsoft Defender for Cloud](#) or [Microsoft Sentinel](#).
- Collect inventory and track changes by using [Azure Automation Change Tracking and Inventory](#).

This article reviews the deployment methods for the Azure Monitor agent VM extension, across multiple production physical servers or virtual machines in your environment, to help you determine which works best for your organization. If you are interested in the new Azure Monitor agent and want to see a detailed comparison, see [Azure Monitor agents overview](#).

Installation options

Review the different methods to install the VM extension using one method or a combination and determine which one works best for your scenario.

Microsoft Monitoring Agent - Azur...

Microsoft Corp.

The Log Analytics agent collects monitoring data from the guest operating system and workloads of virtual machines in Azure, other cloud providers, and on-premises and sends that data into a Log Analytics workspace. It is used by Azure Monitor, Azure Security Center, and Azure Sentinel, among other Azure management solutions.
